

**The BJ operated "Hi-Lo variable flare system"
will discreetly incinerate your waste gases
to levels below legislative emission levels**

Our Earth is continuously impacted by emissions of waste gases. Over the past few years, initiatives to reduce gas emissions have become a major issue for petrochemical, mining, and land fill and food industries.

In addition, Government agencies across the globe have tightened and enhanced legislative controls to minimise and regulate emissions.

BJ operate the patented "Hi-Lo variable tip flare system", which allows waste gases to be destroyed in a discreet and controlled manner.

This innovative system is fully mobile and is designed to achieve a clean and efficient burn of all waste gases, even if the flow rate of gas continuously changes.
